

PicoStar

Scar Revision

HOW DOES IT WORK?

STEP 01

On the Day

The Pico Laser will enter the skin through a micro lens making tiny channels in the skins dermal layer.

STEP 02

Immediately After

These micro-channels kick start wound healing and stimulate new cell growth over the next four weeks.

STEP 03

Re-treatment

Return in four weeks for continued sessions for a course of 4-6. Each time you will see an improvement from the new skin regeneration

STEP 04

Aftercare

After each session you will apply a soothing cream for the first 5 days. it is also important to protect the new skin by avoiding sun exposure and wearing SPF 50

STEP 05

Results

You should see at least 80% improvement after a course of sessions with the best results noticeable 3-6 months later.

More advanced scarring may require more sessions
